

Clean energy

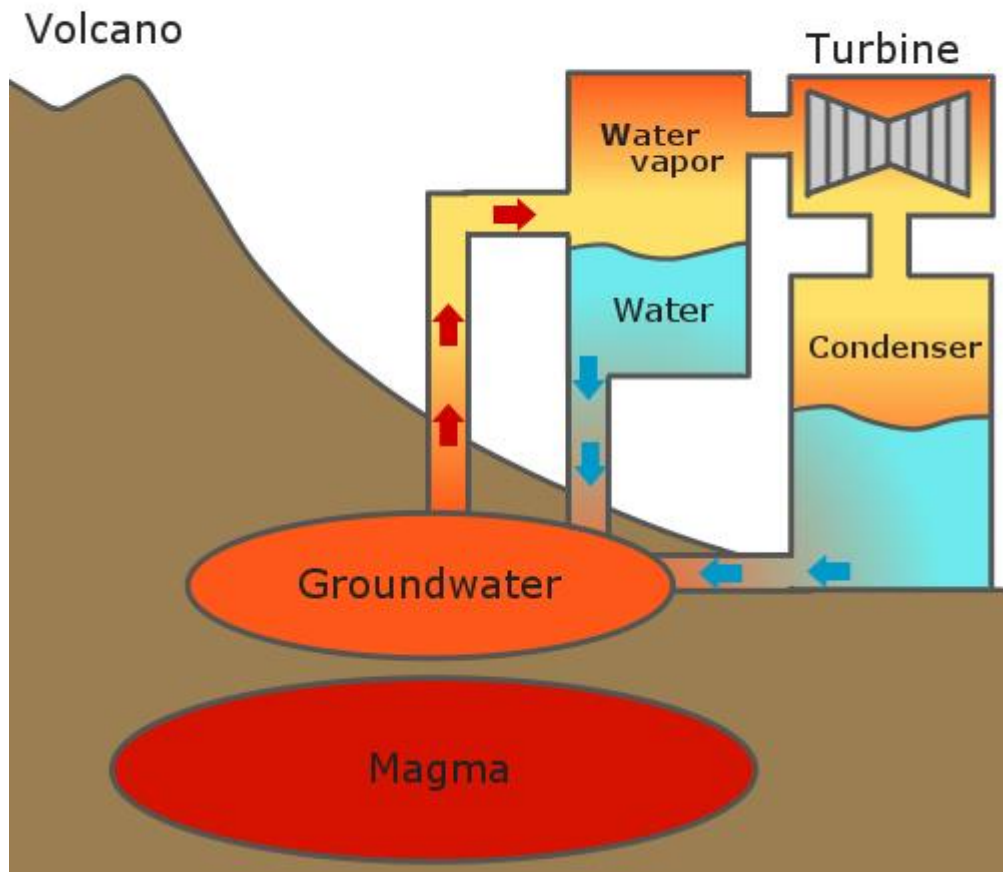

Clean energy is generated by natural energies. Solar, hydro, and geothermal are all called natural energies.

Solar power

The advantages of this power generation are home and cost reduction of equipment, it can reduce () emissions or when it is producing on a small scale, its efficiency does not decrease. The disadvantage is that the night cannot be power generation and the amount of power generation also depends on the () .

Because it is energy that enters the hand anywhere in the world were spend across, as long as the sun is present, we do not have to worry about resource depletion. If I spread the solar cells in half of the () t, that energy would be comparable to the energy demand of all mankind.

Geothermal energy is how to generate using high temperature () etc. It is a mechanism in which high pressure vapor is generated because groundwater mainly touches the () reservoir in a volcanic region, and a turbine turns
